1. The subject matter of independent claim 1 of the present application fulfils the PCT requirements of novelty (PCT Article 33(2)) and inventive step (PCT Article 33(3)).			
Document D1, which is considered to be the closest prior art, describes a scroll compressor from which the vacuum pump as per the subject matter of claim 1 differs in that:			
<ul style="list-style-type: none">the two spiral-shaped projections have an axial clearance controlled by the crank arrangement;axial forces exerted on the pump are taken up essentially by the cranks;the motor is attached to a plate parallel to

the mobile disc; and

- said plate has recesses for a shaft of each crank.

The technical effect of these distinctive features is to provide a vacuum pump in which axial stress is under control..

The problem that the present invention is intended to solve can, therefore, be considered to be that of providing a vacuum pump with enhanced reliability.

None of the distinctive features is disclosed in the available documents or considered to be part of standard technical practice. In the compressor described in D1, the motor is attached to the housing and comprises bearings that contribute substantially to controlling axial clearance and withstanding axial forces.

It follows that there is no indication in the prior art that could prompt a person skilled in the art to solve the problem as proposed in claim 1. The subject matter of claim 1 is, therefore, novel and involves an inventive step.

2. Claims 2-11 are all dependent on claim 1 and relate to preferred embodiments of the invention. As a result, the subject matter of these claims is also considered to be novel and to involve an
